

Instagram integration

Content & Social > Social Publisher

INTEGRATION ADDED | FINAL VALIDATION PENDING

Instagram has been added to COS Social Publisher in staging. Initial configuration and access checks have passed. The final brand-account connection and first successful publication are **not yet verified**; this is not a production launch.

How it works

Current delivery limits

Images: one JPEG per post. **Video/Reels:** requested, not yet implemented.

Scheduling: controls exist; the background scheduler remains inactive.

Web access: supported by the code; the hosted staging address still needs configuration and verification.

Why there was a delay

Developer verification, professional-account/tester setup, permission configuration and missing server settings required coordination across COS, Meta and the account owner. Final connection and publishing tests remain outstanding.

Adding companies and brands

Expansion, controls and next steps

The structure is designed for additional companies and brands without code changes. A central Meta application can normally serve multiple brands; each Instagram account still requires its own authorization.

- 1 Create the company**
An appropriately authorized user adds the company through the existing governed setup. Company names are records, not hardcoded application settings.
- 2 Add its brand and timezone**
Select the company, add its brand and set the publishing timezone. Repeat for additional brands as needed.
- 3 Assign the right access**
Use the approved Content & Social membership process. Existing membership checks and database row-level security remain in place; company visibility is not permission to view, approve or publish content.
- 4 Prepare the Instagram account**
Use a Business or Creator account. Instagram Login does not require a linked Facebook Page. For staging, add the account as an authorized tester and accept the invitation. [1]
- 5 Connect and verify the correct brand**
In Social Publisher, select the company and brand, click Connect Instagram, complete the owner's consent and refresh results. Verify the account is connected under the intended brand before testing a post.

Next milestones

1. Confirm the hosted staging address and complete the first account connection.
2. With approval, activate the worker and verify a controlled image post and a scheduled post.
3. Implement and test video/Reels, followed by additional social platforms. No delivery date is committed yet.

Management input needed

Confirm account ownership, approvers and publishing access, brand timezones, approved test content and the next platform priority. Wider onboarding must meet Meta's applicable access, verification and app-review requirements.
